

Arsenal FC — AI Research Engineer

Managed AI Employee

Embedded with Men's First Team Analysis | Deployed in 48 hours | Flat fee

The Problem

Arsenal's published job description admits the exact gap we solve: insight is not reaching coaching decisions fast enough, and applied research is bottlenecked by scarce full-stack engineering capacity. Analysts and coaches operate in different languages. Matchday and training schedules fragment delivery. Manual tagging, clip preparation, and dashboard plumbing consume hours that should go to high-judgment analysis.

The Solution

A managed AI Research Engineer embedded directly with the First Team Analysis department. Not a chatbot. A production teammate that builds full-stack applications, automates analysis workflows, and translates data outputs into coaching-ready language. It never misses a session, never sleeps, and ships working prototypes on the same calendar day you brief it.

What It Delivers

- Full-stack data applications — Python backend, SQL pipelines, React/TypeScript frontends tailored to coaching workflows.
- Automated football analysis — event tagging, clip generation, scouting shortcuts using applied ML, removing repetitive analyst labor.
- Coaching-aligned insights — interfaces and outputs designed for non-technical staff, built from tactical requirements, not dashboard defaults.
- Applied AI specialist capability — xG models, passing networks, player-load baselines, and set-piece optimization, all in production form.
- Research-to-deployment pipeline — turns First Team requirements into shipped tooling fast, with real-world match constraints built in.

How It Works

- Discovery: 20-minute call with the Head of Analysis to define one primary workflow to automate.
- Build: 24-48 hours to ship a working prototype using existing data schemas and export formats.
- Embed: Telegram/iMessage/Slack thread connects the agent to analysts and coaches daily.
- Onboard: handoff session with staff; agent learns club-specific vocabulary and output format.
- Iterate: weekly delivery improvements driven by actual match/training requests, not roadmaps.

Price

£5,000 / month

Flat fee. One defined outcome owned end to end. No per-seat charges. Includes hosting, model access, observability, and weekly iteration.

Proof

- Nick Vasilescu closed a design agency at \$5,000/month via his Hermes agent Dewey on 21 Jul 2026.
- Dewey autonomously onboarded client agents into Slack, handled support on iMessage, and booked cloud compute without human intervention — documented on X and the Build With AI podcast.
- The managed-AI-employee model is already in market with confirmed revenue, not theory.

Why Arsenal

Arsenal are not missing analyst headcount; they are missing build speed and translation layer between data and coaching decisions. A managed AI employee is the fastest path from research insight to first-team-ready tooling, with zero recruiting delay and zero matchday scheduling friction.
