

Managed AI Employee — Arsenal FC Executive Summary ## 1. HEADLINE A managed AI Research Engineer for the First Team Analysis department — deployed, integrated, and delivering by Monday. --- ## 2. THE PROBLEM Arsenal's job description says it plainly: join the Data Analytics team, embed with Men's First Team Analysis, and ship end-to-end internal products that keep the club at the forefront of football analytics. That is harder than it looks. ** Recruitment pressure.** Elite Research Engineers with advanced quantitative backgrounds, full-stack fluency, and applied ML skills are scarce. Arsenal is hiring *now* — the role closes Thursday 6 August 2026 — which signals the need is immediate, not speculative. ** Speed of delivery.** Full-stack applications tailored to coaching workflows don't ship overnight. Requirements from the Head of Software & Analytics and the Men's First Team Head of Analysis need translation into working prototypes, then production-grade tooling. ** Research-to-tool gap.** Applied research only wins if it grounds concrete coaching needs and survives real-world matchday constraints. That translation layer — between a model and a usable product used under pressure at the Sobha Realty Training Centre — is where most projects stall. ** Bottleneck.** A single hire cannot own full-stack builds, ML automation, AI strategy, *and* stakeholder management across a high-intensity, schedule-flexible environment without support. The club knows this. That is why they posted the role. --- ## 3. THE SOLUTION **Your AI Research Engineer.** A managed AI employee that works inside Men's First Team Analysis as a Research Engineer — built on the same stack that powers verified live deployments at \$5,000/month elsewhere. It does not replace your staff. It executes the build, automation, and prototyping load so your analysts and engineers spend their time on high-judgment work, not infrastructure. Embedded. Accountable. Turned off when you want it off. --- ## 4. WHAT IT DELIVERS Five deliverables mapped directly to the job description: 1. **Full-stack scouting and match-analysis applications.** Rapid prototyping and production build-out of data-driven interfaces tailored to Football Analysis stakeholder requirements. 2. **Automated football analysis workflows.** Applied ML pipelines that streamline repetitive analysis tasks, from data ingestion to model inference, running reliably across training and matchday cadences. 3. **Embedded technical solutions for First Team Analysis.** Deep integration with the Analysis department: the agent understands coaching workflows, gathers requirements from first-team staff, and delivers shipped features — not POCs that die in a folder. 4. **Applied AI/ML research implementation.** Subject-matter expertise in football-specific AI techniques: opponent modelling, event-stream analysis, and tracking-data pipelines translated into working tooling. 5. **Research-to-production translation layer.** Every research output is validated against concrete coaching constraints before it moves forward. The agent bridges the gap between data science and the touchline. --- ## 5. HOW IT WORKS **48-hour deployment model.** 1. Discovery call — 20 minutes. One workflow chosen. 2. Context dump — you share existing data pipelines, coaching frameworks, and analysis priorities. 3. Agent build — templated runtime cloned, configured with club-specific data sources and tooling. 4. Integration — the agent appears in your Slack/Telegram/team channel, ready to receive tasks. 5. Live — hand-off complete. Iteration begins immediately. Zero internal LLM / provider / stack exposure. You own outcome, we own

delivery. --- ## 6. PRICE **£5,000 / month. Per client. Flat.** One price. One outcome. No per-seat fees. No hidden operational charges. --- ## 7. PROOF Verified public signals only: * **Nick Vasilescu's \$5K/month deal.** Closed a design-agency client on 21 July 2026. Dewey — Nick's own Hermes agent — built the client agent and onboarded it to Slack within 48 hours of payment. * **Build With AI podcast.** Corey Ganim ran a full episode breaking down Nick Vasilescu's managed-AI-employee system: the offer, the 48-hour delivery loop, the exact tool stack, and the resale model. * **Dewey on iMessage loops.** Nick operates Dewey via iMessage for autonomous build, onboarding, and support. As of 29 July 2026, agents in his fleet are being given their own iMessage phone numbers for closed-loop notifications — always-on, always reachable, no dashboard required. --- ## 8. NEXT STEP One workflow. One call. One page scope statement. Book a 20-minute call → [**beacons.ai/humanarchitect**](https://beacons.ai/humanarchitect)
