

The business world is about to split in two.

Companies that operate AI. And companies that are run by AI workers. The second group will not compete with the first. It will outrun it.

The difference most miss

ChatGPT is a tool you **operate**.

NOHUMA is a worker that **runs without you**.

A tool saves you time when you remember to use it. A worker ships the result while you sleep — replies sent, invoices chased, slots booked, reports written. The business runs. You watch.

This is not faster software.

- A tool stops the moment you stop typing. A worker doesn't.
 - A tool is a cost you operate. A worker is leverage that compounds.
 - You don't adopt it. You **hire it** — and it shows up every day.
-

The last time work restructured this hard, the businesses that moved first didn't win a little. They redrew the map. This is that moment, and almost no one is positioned for it yet.

NOHUMA is a worker, not a tool.

We build and run a worker inside your business for a flat £5,000 a month. Its own computer, its own email, its own line to your customers. It does the job a person would — but it never sleeps, quits, or bills you for sick days.

The offer

- Live in 48 hours — or the first month is refunded.
 - You watch it work from a real control panel.
 - Month to month. Stay because it works.
-

The shift is happening. The only question is whether your business is among the ones run by a worker — or still operating tools and losing the hours a worker would have returned.
